Homework Questions?

My Solution

topic

Some Stuff

sample code

Lists

Lists Literals

```
>>> []
```

```
[]
```

```
>>> list()
```

```
[]
```

```
>>> [1, 2, 3]
```

```
[1, 2, 3]
```

```
>>> [1, 3.14, "abc"]
```

```
[1, 3.14, 'abc']
```

List Indexing

Indexing just like all sequences

```
>>> food = ['spam', 'eggs', 'ham']
```

```
>>> food[2]
```

```
'ham'
```

```
>>> food[0]
```

```
'spam'
```

```
>>> food[42]
```

```
Traceback (most recent call last):
```

```
  File "<stdin>", line 1, in <module>
```

```
IndexError: list index out of range
```

List Mutability

Lists are mutable

```
>>> food = ['spam', 'eggs', 'ham']  
>>> food[1] = 'raspberries'  
>>> food  
['spam', 'raspberries', 'ham']
```

List Elements

Each element is a value, and can be in multiple lists and have multiple names (or no name)

```
>>> name = 'Brian'
>>> a = [1, 2, name]
>>> b = [3, 4, name]
>>> name
'Brian'
>>> a
[1, 2, 'Brian']
>>> b
[3, 4, 'Brian']
>>> a[2]
'Brian'
>>> b[2]
'Brian'
```

List Methods

`.append()`, `.insert()`

```
>>> food = ['spam', 'eggs', 'ham']
>>> food.append('sushi')
>>> food
['spam', 'eggs', 'ham', 'sushi']
>>> food.insert(0, 'carrots')
>>> food
['carrots', 'spam', 'eggs', 'ham', 'sushi']
```

List Methods

`.extend()`

```
>>> food = ['spam', 'eggs', 'ham']  
>>> food.extend(['fish', 'chips'])  
>>> food  
['spam', 'eggs', 'ham', 'fish', 'chips']
```

could be any sequence:

```
>>> food  
>>> ['spam', 'eggs', 'ham']  
>>> silverware = ('fork', 'knife', 'spoon') # a tuple  
>>> food.extend(silverware)  
>>> food  
>>> ['spam', 'eggs', 'ham', 'fork', 'knife', 'spoon']
```

List Methods

`pop()`, `remove()`

```
In [203]: food = ['spam', 'eggs', 'ham', 'toast']
```

```
In [204]: food.pop()
```

```
Out[204]: 'toast'
```

```
In [205]: food.pop(0)
```

```
Out[205]: 'spam'
```

```
In [206]: food
```

```
Out[206]: ['eggs', 'ham']
```

```
In [207]: food.remove('ham')
```

```
In [208]: food
```

```
Out[208]: ['eggs']
```

List Constructor

`list()` accepts any sequence and returns a list of that sequence

```
>>> word = 'Python '  
>>> chars = []  
>>> for char in word:  
...     chars.append(char)  
>>> chars  
['P', 'y', 't', 'h', 'o', 'n', ' ']  
>>> list(word)  
['P', 'y', 't', 'h', 'o', 'n', ' ']
```

String to List to String

If you need to change individual letters... you can do this, but usually `somestring.replace()` will be enough

```
In [216]: name = 'Chris'
In [217]: lname = list(name)
In [218]: lname[0:2] = 'K'
In [219]: name = ''.join(lname)
In [220]: name
Out[220]: 'Kris'
```

Building up strings in a list

```
In [221]: msg = []
```

```
In [222]: msg.append('The first line of a message')
```

```
In [223]: msg.append('The second line of a message')
```

```
In [224]: msg.append('And one more line')
```

```
In [225]: print '\n'.join(msg)
```

```
The first line of a message
```

```
The second line of a message
```

```
And one more line
```

List Slicing

Slicing makes a copy

```
In [227]: food = ['spam', 'eggs', 'ham', 'sushi']
```

```
In [228]: some_food = food[1:3]
```

```
In [229]: some_food[1] = 'bacon'
```

```
In [230]: food
```

```
Out[230]: ['spam', 'eggs', 'ham', 'sushi']
```

```
In [231]: some_food
```

```
Out[231]: ['eggs', 'bacon']
```

List Slicing

Easy way to copy a whole list

```
In [232]: food
```

```
Out[232]: ['spam', 'eggs', 'ham', 'sushi']
```

```
In [233]: food2 = food[:]
```

```
In [234]: food is food2
```

```
Out[234]: False
```

but the copy is “shallow”:

<http://docs.python.org/library/copy.html>

List Slicing

“Shallow” copy

```
In [249]: food = ['spam', ['eggs', 'ham']]
In [251]: food_copy = food[:]
In [252]: food[1].pop()
Out[252]: 'ham'
In [253]: food
Out[253]: ['spam', ['eggs']]
In [256]: food.pop(0)
Out[256]: 'spam'
In [257]: food
Out[257]: [['eggs']]
In [258]: food_copy
Out[258]: ['spam', ['eggs']]
```

Name Binding

Assigning to a name does not copy:

```
>>> food = ['spam', 'eggs', 'ham', 'sushi']
>>> food_again = food
>>> food_copy = food[:]
>>> food.remove('sushi')
>>> food
['spam', 'eggs', 'ham']
>>> food_again
['spam', 'eggs', 'ham']
>>> food_copy
['spam', 'eggs', 'ham', 'sushi']
```

List Iterating

Iterating over a list

```
>>> food = ['spam', 'eggs', 'ham', 'sushi']
>>> for x in food:
...     print x
...
spam
eggs
ham
sushi
```

Processing Lists

A common pattern

```
filtered = []  
for x in somelist:  
    if should_be_included(x):  
        filtered.append(x)  
del(somelist)  # maybe
```

you don't want to be deleting items from the list
while iterating...

Mutating Lists

if you're going to change the list, iterate over a copy for safety

```
>>> food = ['spam', 'eggs', 'ham', 'sushi']  
>>> for x in food[:]:  
...     # change the list somehow  
...
```

insidious bugs otherwise

operators vs methods

What's the difference?

```
>>> food = ['spam', 'eggs', 'ham']  
>>> more = ['fish', 'chips']  
>>> food = food + more  
>>> food  
['spam', 'eggs', 'ham', 'fish', 'chips']
```

```
>>> food = ['spam', 'eggs', 'ham']  
>>> more = ['fish', 'chips']  
>>> food.extend(more)  
>>> food  
['spam', 'eggs', 'ham', 'fish', 'chips']
```

(the operator makes a new list...)

in

```
>>> food = ['spam', 'eggs', 'ham']  
>>> 'eggs' in food  
True  
>>> 'chicken feet' in food  
False
```

reverse()

```
>>> food = ['spam', 'eggs', 'ham']  
>>> food.reverse()  
>>> food  
['ham', 'eggs', 'spam']
```

sort()

```
>>> food = ['spam', 'eggs', 'ham', 'sushi']  
>>> food.sort()  
>>> food  
['eggs', 'ham', 'spam', 'sushi']
```

note:

```
>>> food = ['spam', 'eggs', 'ham', 'sushi']  
>>> result = food.sort()  
>>> print result  
None
```

Sorting

How should this sort?

```
>>> s  
[[2, 'a'], [1, 'b'], [1, 'c'], [1, 'a'], [2, 'c']]
```

Sorting

How should this sort?

```
>>> s
[[2, 'a'], [1, 'b'], [1, 'c'], [1, 'a'], [2, 'c']]

>>> s.sort()
>>> s
[[1, 'a'], [1, 'b'], [1, 'c'], [2, 'a'], [2, 'c']]
```

Sorting

You can specify your own compare function:

```
In [279]: s = [[2, 'a'], [1, 'b'], [1, 'c'], [1, 'a'], [2, 'c']]
In [281]: def comp(s1,s2):
.....:     if s1[1] > s2[1]: return 1
.....:     elif s1[1]<s2[1]: return -1
.....:     else:
.....:         if s1[0] > s2[0]: return 1
.....:         elif s1[0] < s2[0]: return -1
.....:     return 0
In [282]: s.sort(comp)
In [283]: s
Out[283]: [[1, 'a'], [2, 'a'], [1, 'b'], [1, 'c'], [2, 'c']]
```

Sorting

Mixed types can be sorted.

“objects of different types always compare unequal,
and are ordered consistently but arbitrarily.”

`http:
//docs.python.org/reference/expressions.html#not-in`

Searching

Finding or Counting items

```
In [288]: l = [3,1,7,5,4,3]
```

```
In [289]: l.index(5)
```

```
Out[289]: 3
```

```
In [290]: l.count(3)
```

```
Out[290]: 2
```

List Performance

- indexing is fast and constant time: $O(1)$
- x in s proportional to n : $O(n)$
- visiting all is proportional to n : $O(n)$
- operating on the end of list is fast and constant time: $O(1)$
append(), pop()
- operating on the front (or middle) of the list depends on n :
 $O(n)$
pop(0), insert(0, v)
But, reversing is fast. Also, collections.deque

<http://wiki.python.org/moin/TimeComplexity>

Lists vs. Tuples

List or Tuples

If it needs to be mutable: list

If it needs to be immutable: tuple
(dict key, safety when passing to a function)

Otherwise ... taste and convention

List vs Tuple

Convention:

Lists are Collections (homogeneous):

- contain values of the same type
- simplifies iterating, sorting, etc

tuples are mixed types:

- Group multiple values into one logical thing – Kind of like simple C structs.

List vs Tuple

- Do the same operation to each element?
- Small collection of values which make a single logical item?
- To document that these values won't change?
- Build it iteratively?
- Transform, filter, etc?

List vs Tuple

- Do the same operation to each element? **list**
- Small collection of values which make a single logical item? **tuple**
- To document that these values won't change? **tuple**
- Build it iteratively? **list**
- Transform, filter, etc? **list**

List Docs

The list docs:

`http://docs.python.org/library/stdtypes.html#
mutable-sequence-types`

(actually any mutable sequence....)

tuples and commas..

Tuples don't NEED parentheses...

```
In [161]: t = (1,2,3)
```

```
In [162]: t
```

```
Out[162]: (1, 2, 3)
```

```
In [163]: t = 1,2,3
```

```
In [164]: t
```

```
Out[164]: (1, 2, 3)
```

```
In [165]: type(t)
```

```
Out[165]: tuple
```

tuples and commas..

Tuples do need commas...

```
In [156]: t = ( 3 )
```

```
In [157]: type(t)
```

```
Out[157]: int
```

```
In [158]: t = (3,)
```

```
In [159]: t
```

```
Out[159]: (3,)
```

```
In [160]: type(t)
```

```
Out[160]: tuple
```
